Hospital Medical Center

THE UNIVERSITY
OF QUEENSLAND
AUSTRALIA

Overall Goal: To Define the Molecular and Microstructural Basis of Genitourinary Systems Development

Developmental Stages

Anatomical Structures

(built an ontology of anatomical structures and stages!)

Renal

Lower Urinary Tract

Repro-Gonadal

GeneChips: > 260 micro-tissue samples obtained via laser capture, FACS, or micro dissection

in situ hybridization: >2700 genes/-specific whole mount and high resolution ISH

Data Mining Goals of the GUDMAP Resource

enable users to identify and characterize

- genes
- anatomic structures
- pathways and processes

that are critical for development and function of GU structures and functions

Use GATACA_GUDMAP to generate a set of genes known to be involved in development and function of LUT (ureter, bladder, urethra, and external genitalia)

e.g. BAT3, BMP7, DLG1, EFNB2, EYA1, FGFR2, FOXC1, FOXC2, FOXD1, GDF11, GDNF, GFRA1, GREM1, HOXA11, HOXD11, ITGA8, KIAA1217, LAMC1, LHX1, NFIA, PAX2, PPP3R1, PYGO1, PYGO2, RARA, RARG, RET, SALL1, SALL2, SALL4, SIX1, SLIT2, SMAD4, SPRY1, TP63

Export gene list to

WWW.GUDMAP.ORG

examine patterns of transcript expression in both microarray & *in situ hybridization* datasets

LUT “Diseasome” Genes Analyzed using the GUDMAP Microarray Database

- Step 1. identify genes and good probes known to be critical for development of structure and function of the lower urogenital system
- Step 2. derive gene expression clusters over the GUDMAP **LUT** expression database
- Step 3. Analyze identified clusters for shared features and co-functions with based on other knowledge e.g. pathways, functions, cis elements, microRNA target sequences

EYA1,NIPBL,SALL4,SALL1,SIX1,FOXD2,HTR3A,F
OXD1,GDNF: **Vesicoureteral reflux, short ureter,
Hyposadias,..**

**Gene Cluster 5: Network/
Interactome-based
Enrichment Analysis**

Cluster C5 is enriched in genes required for ureter, urethra, and normal penis development and contains a densely connected set of genes known to participate in Hedgehog and WNT signaling, and appendage and digit development

Identifying hypospadias-associated pathways: reference genes from each LUT diseaseome cluster (Clusters 7, 9, 11)

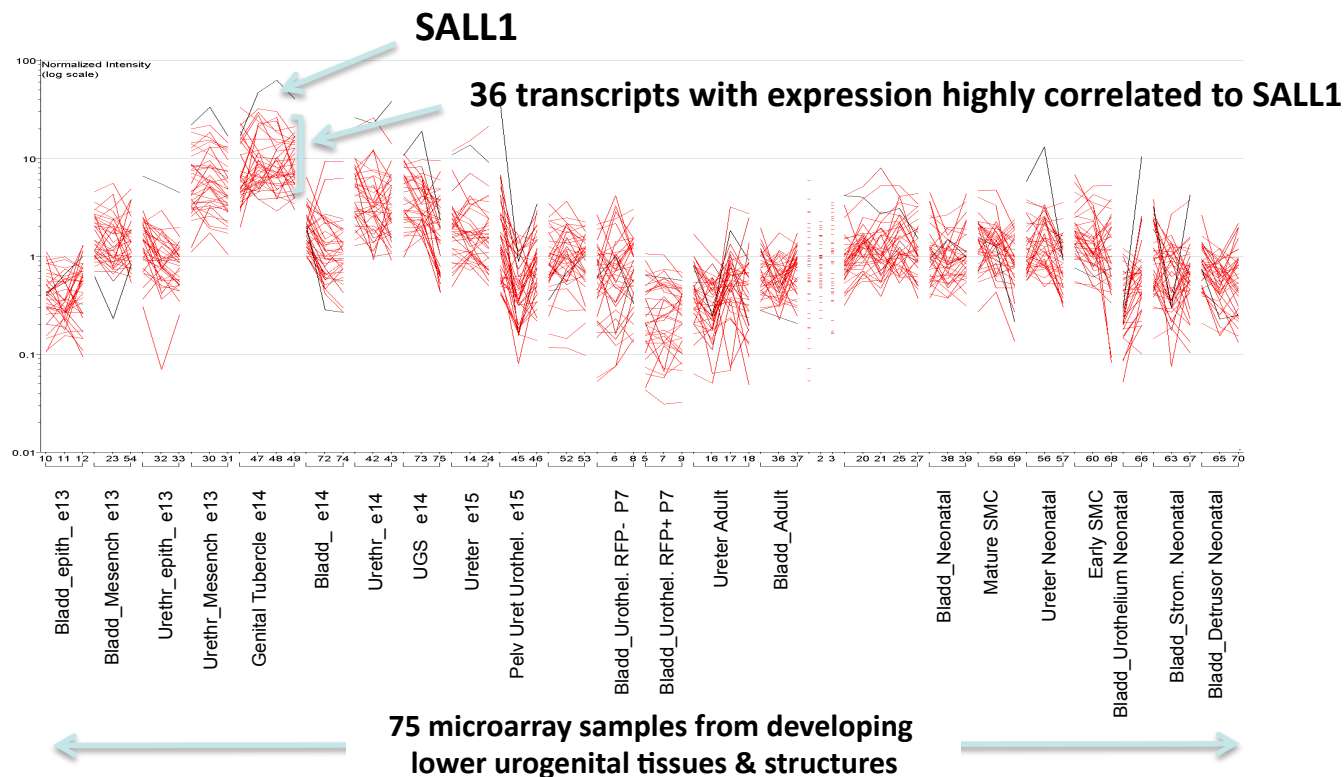

Using the Gudmap Database to Extend Knowledge and to Make Novel Hypotheses of Critical Genes for Genito-Urinary Tract Developmental Based on Syn-Expression Gene Set Analysis

Example Approach:

- Step 1. Start from a known key gene: i.e. causes human disorder in a relevant structure (e.g. Sall1)
- Step 2. Identify good probe(s) for selected key gene
- Step 3. Perform microarray dataset analysis to identify a “syn-expressed geneset” across a set of relevant samples
- Step 4. Prioritize identified genes for evaluation of co-function with key gene, based on other knowledge e.g. pathways, functions

Example: **SALL1** --*Towne-Brockes syndrome*: anal and urethral abnormalities; mouse: expression in urethral mesenchyme, caudal hindgut, genital tubercle expression)

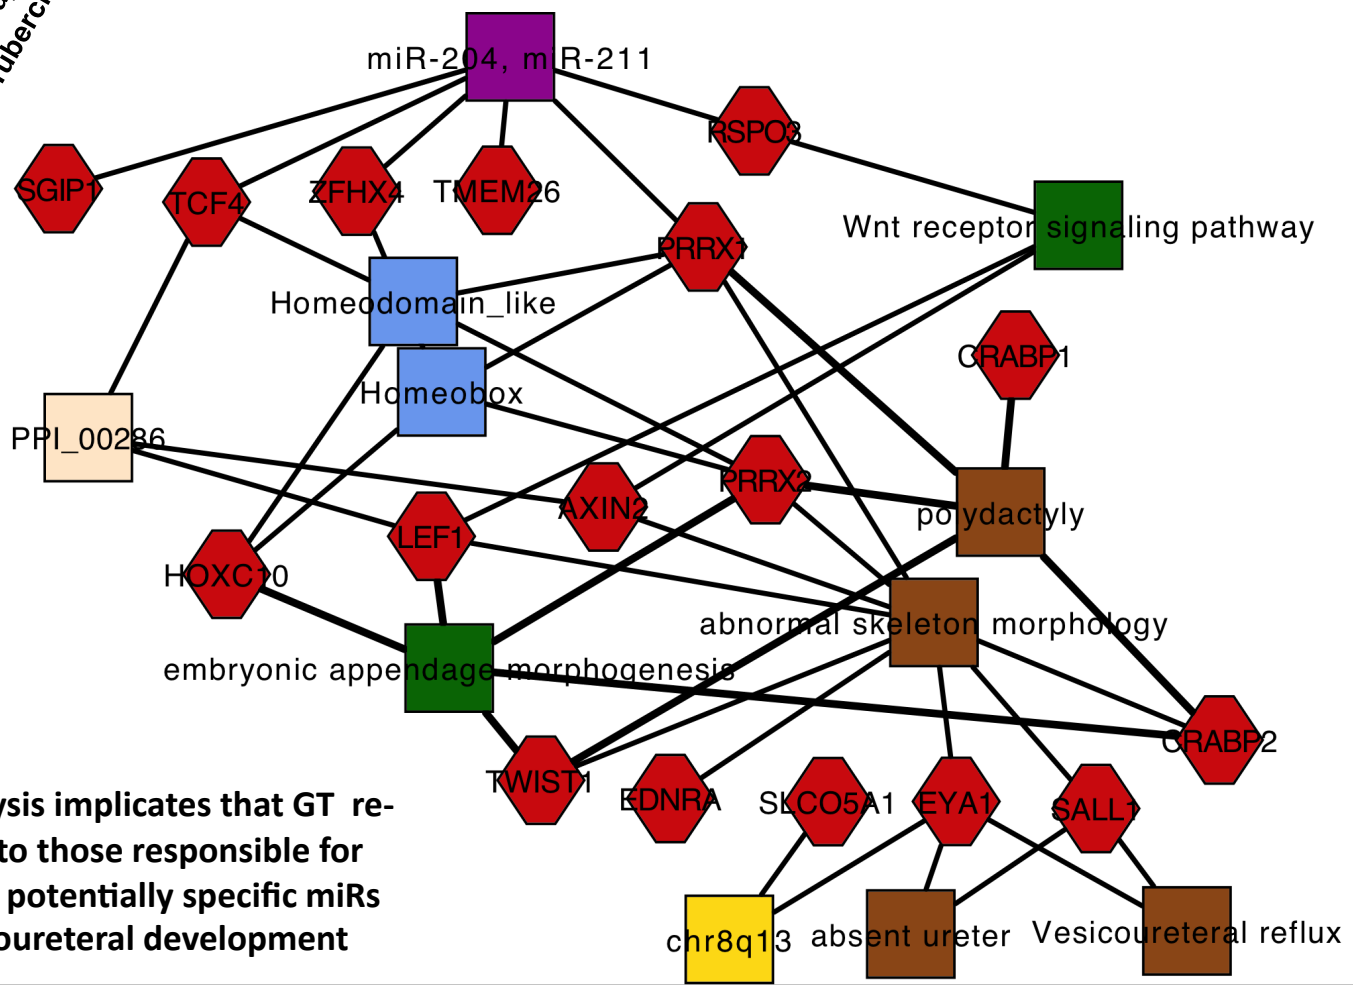

From GUDMAP array data: Sall1-correlated expression pattern

Pattern-match based identification of 36 genes

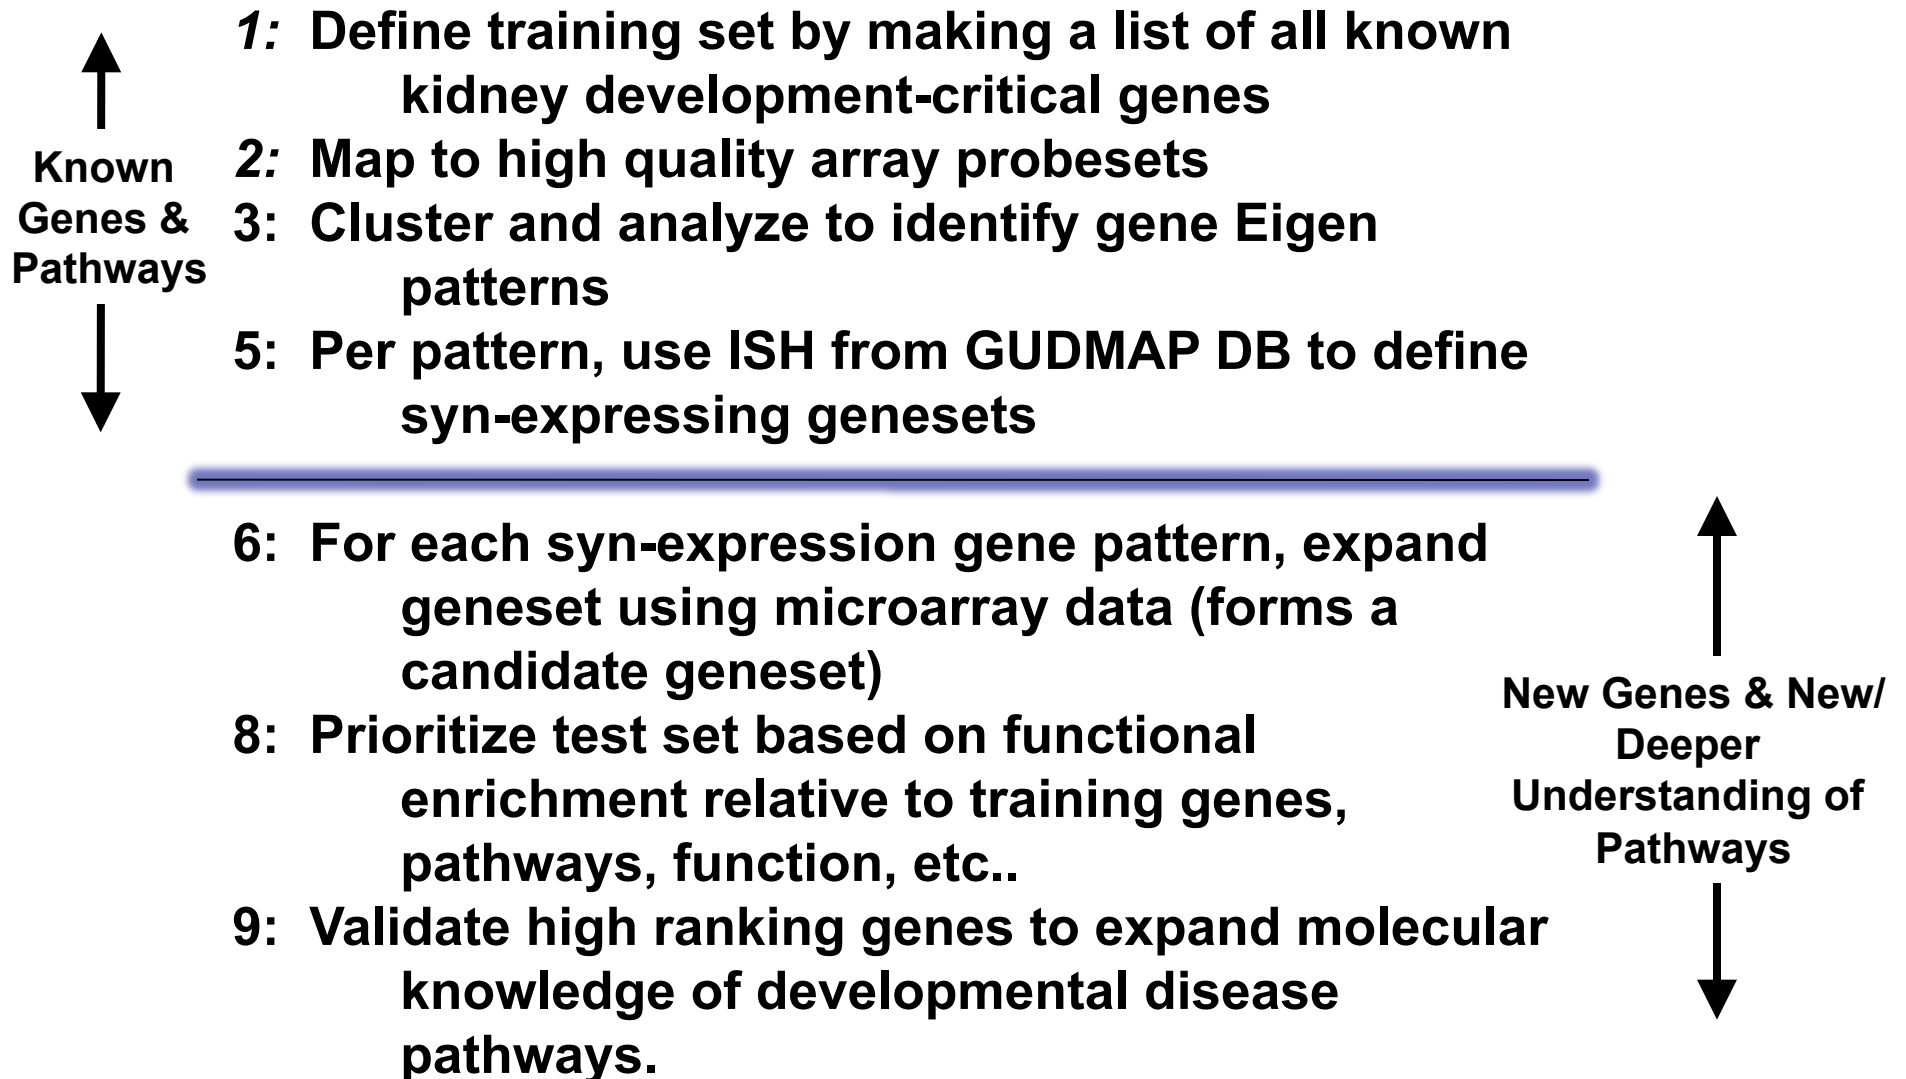

Sall1-correlated Gene Cluster: Network/ Interactome-based Enrichment Analysis

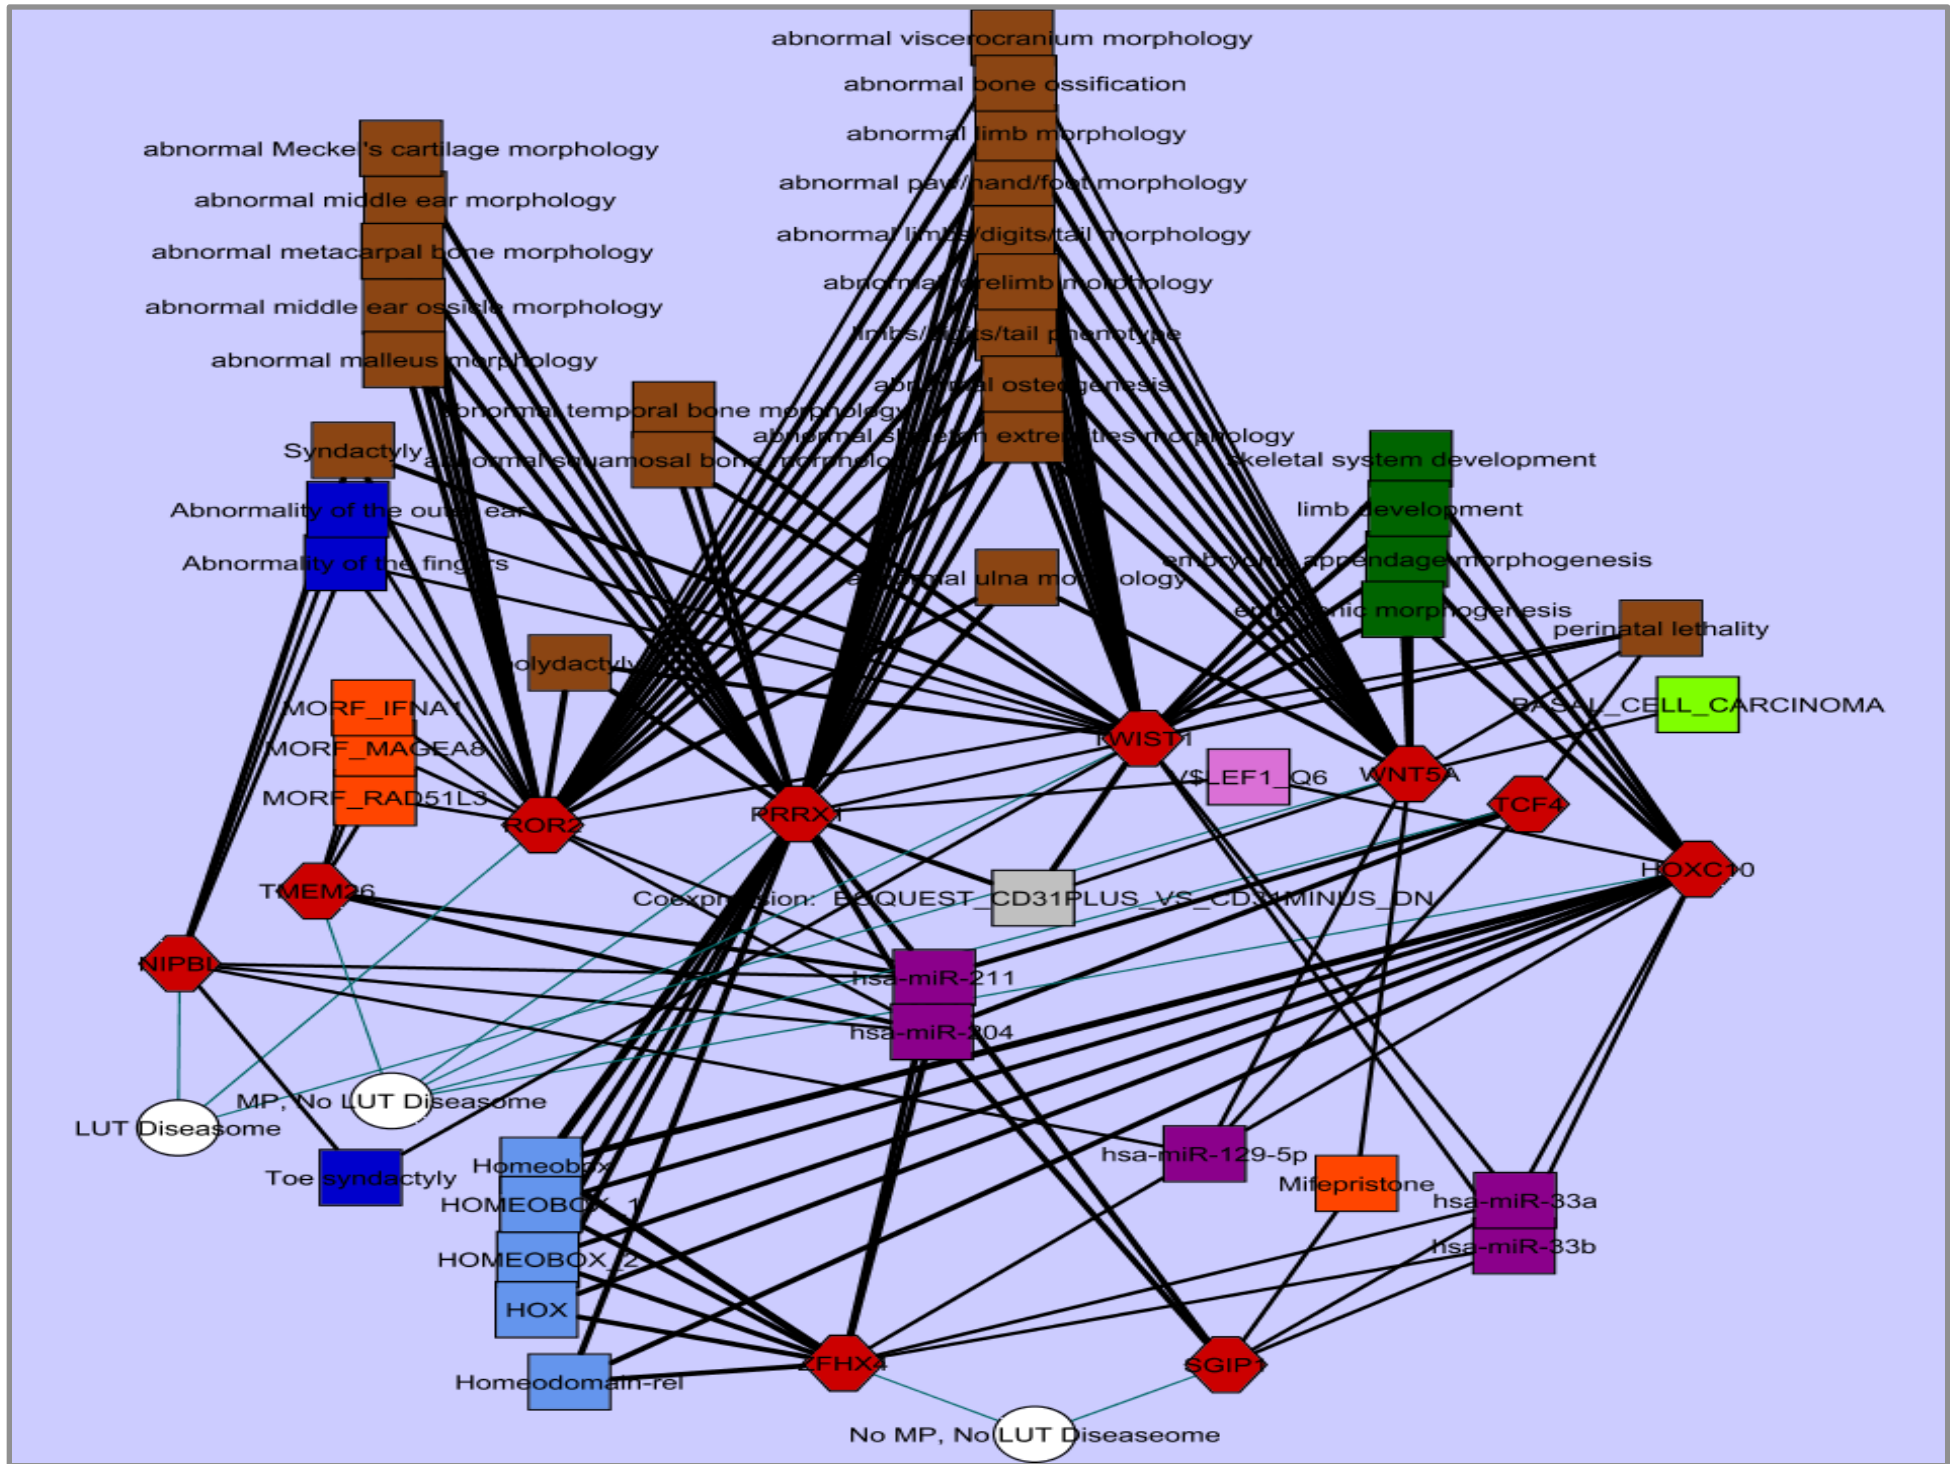

Urethra_Mesench e13
Urethra_e14
Genital Tubercle e14

Sall1-correlated gene cluster analysis implicates that GT reuses a Wnt/Hox program similar to those responsible for skeletal/limb morphogenesis, and potentially specific miRNAs may be used in ureter and vesicoureteral development

Diseasome Concept—use high-resolution expression data to expand known disease genes with observed genes that fit into categories of importance for development of organ-specific structure and function
